FOR IMMEDIATE RELEASE

### Recognizing Glyphosate-Resistant Weeds

Is glyphosate less effective than 10 years ago? Can you recognize the presence of glyphosate-resistant weeds in a field? If you are unsure, plan to attend one of the field tours that will be held at Plummer and Hawley, Minnesota on September 9 and 10, 2009. Glyphosate resistance develops over time in a field. Early recognition of the symptomology of surviving plants and patterns within a field will allow more effective management of glyphosate on your farm or the fields you manage. Field tours will be held at Plummer and Hawley to teach you how to recognize resistance symptomology and strategies for managing resistance. Farmers, consultants, and agribusiness employees are welcome to attend.

<u>Date</u>	<u>Starting location</u>	<u>Time</u>
Wednesday, September 9	Plummer, MN Plummer Co-op Creamery (Cenex Station)	1 pm
Thursday, September 10	Hawley, MN RDO Equipment	9:30 am

There tours are sponsored by the Minnesota Soybean Research and Promotion Council, Minnesota Extension Service, NDSU, Dow AgroSciences, and Valent. There is no charge to participate. For more information contact Carlyle Holen at 218-281-8691.
